

Redactor+ by TeraDact automatically detects and removes sensitive data from documents, audio, and video. FOI, disclosure, privacy compliance, and safe data sharing across government and enterprise made easier and safer.

Support for all your Files

One platform for **Audio, Video, Documents, Emails, Spreadsheets, Images, Databases, and more.** Use the same platform to handle all your sensitive data needs.

Redaction's Hardest Problems, Solved

Purpose-built models we train in house go beyond pattern matching to link the same person across files and frames, and to identify information that's **sensitive because of what it means:** inside information, health data, trade secrets, and more.

Built for Volume

Bulk-process entire cases, disclosure requests, and archives in **a single pass.** Hours of body-worn footage and thousands of documents handled without a person reviewing every page.

You Stay in Control

Nothing is redacted without your sign-off. Reviewers **see every proposed redaction** grouped by entity, adjust in seconds, and export with a **complete audit trail** of what was changed, by whom, and why.

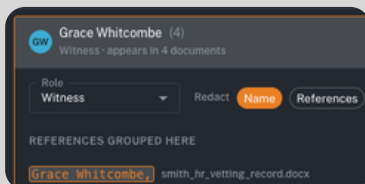

Proven Where it Matters Most

Trusted by **police forces**, national law enforcement frameworks, **government agencies** and public housing authorities **handling FOI at scale.** Deployed in environments where a missed redaction is not an option.

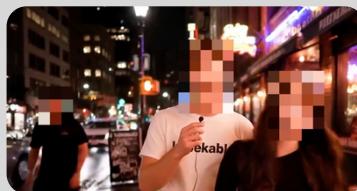

Entity Awareness

Every person identified and grouped by role, automatically, within and across documents.

Video Redaction

Faces, bodies, vehicles, screens, and more. Detected and followed as they move.

Transcribe & Redact

Speech transcribed and separated by speaker, then redacted in audio and in text.
